# HomePage

First thing anyone will see on a home page is a placeholder where the user can input the user file path. Home page is created in such a way that users will feel very easy to interact with our product. Here is how our home page is.

- **What is “Enter absolute path.”?**

Ans) In this place You have to paste the location of the folder in which the files are present.

For example, if the file name is testdata.csv and it is present in the same path then enter testdata.csv otherwise enter the absolute path .

.

- **What is Input File Predict?**

Ans) Suppose you have pasted the path inside the section ‘Enter absolute path’. Now when you will hit button Input File Predict. The path file will go from html page to our main.py file and after that .csv files present inside it will be validated and prediction will be done.

- **What is Results Section?**

Ans) This section will show the name of the folder created and few results of the predicted data. If incase something exception happens inside the system it will throw error occurred statement. Now you have to check the logs file in folder All\_logs, there are two logging file one is Training\_logs and second is Testing\_logs. Logs generated during training is inside training logs and during prediction time it is inside testing\_logs.

## **NOTE:**

It will simply create a folder names `Prediction_Output_Files` in your path specified and in that the output files we stored and with that log file will also be generated.
